

# OUT OUT, DAMNED SPOT SCRATCH!

**Macbeth is just as annoyed by scratched safety glasses as you!**

The number one complaint we hear about safety glasses? Scratches. What can one do about it? Research shows not much. There are many different products that claim to remove scratches, but most reviews are negative. Just search “Liquid Scratch Removal Kit” if you want to get an earful. Brusso, Armor etch, and Glass Etching Cream are just a few of the suggestions out there. Many of these are actually removing the anti-reflective coating where the scratches were located, not removing the scratches from the plastic.

Here are some things you **CAN** do:

1. Use a carrying case when not in use.
2. Buy scratch resistant lenses (NOT the same as scratch proof!) We have noticed a difference in the coating helping decrease the amount of scratching, but it's not a perfect world.
3. We've noticed that mid-to-higher end safety glasses are less likely to get scratched- the \$2 pair is more likely to get scratched.
4. Don't clean them with paper towels! Use a clothe instead.

I wish I had better news for you. Here, let me make you feel better. You could have bought the \$15 Liquid Scratch Removal kit that is worthless to get rid of the scratches in your \$7 safety glasses.
